# CAPTURING PACKETS

Frames

Colors  
mean  
Something

A packet is a group of data at 1 layer of the network stack.

Multiple frames can go into 1 packet.  
Frames come into the network interface.

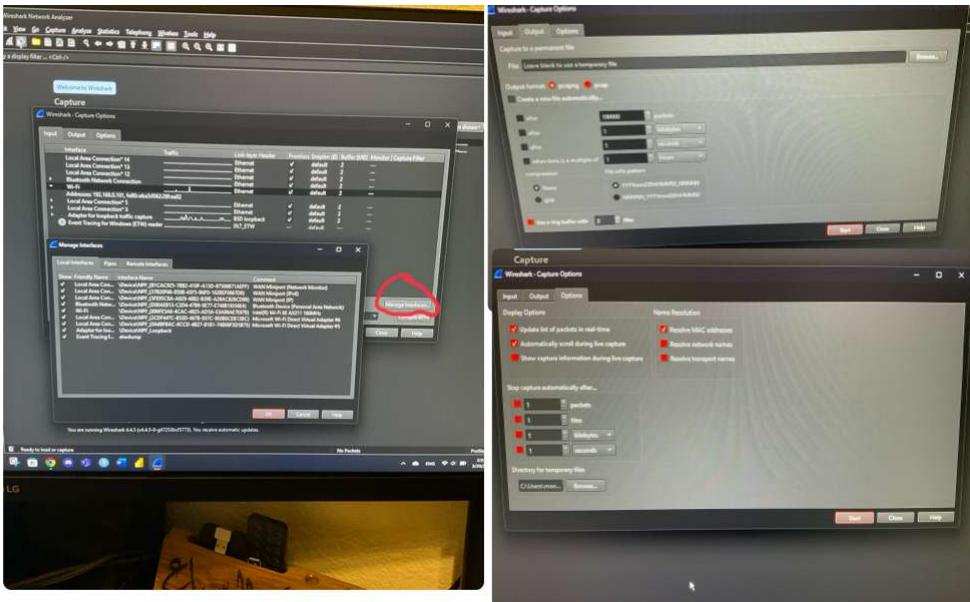

messages going across the network interface

Frames can be aggregated up into packets in the IP layer.

Segments at TCP

# Starting a Packet Capture

## Capturing Options:

## Filters:

- use the filter bar to find something specific.
- When the bar is red it didn't find anything. When the bar is green it found something.
- The filter will be in the SOURCE or Destination column

## Sorting & Searching:

- Press edit → Find Packet.

```

Frame 96: 159 bytes on wire (1272 bits), 159 bytes captured (1272 bits) on interface 0
Interface Name: Intel(R) Dual Band Wireless-AC 4225-ADSL-Ethernet Adapter
Source MAC Address: Intel(R) Dual Band Wireless-AC 4225-ADSL-Ethernet Adapter (08:00:20:2d:0c:00)
Destination MAC Address: Broadcast (ff:ff:ff:ff:ff:ff)
Ether Type: Ethernet (3000)
Link Layer Type: Ethernet (3000)
Protocol Version: 2.0
Time to live: 64
Time offset: 0.000 seconds
Time since previous capture: 0.000 seconds
Time since first frame: 0.000 seconds
Time since last frame: 0.000 seconds
Time since last packet: 0.000 seconds
Time since first packet: 0.000 seconds
Time since last frame or first packet: 0.000 seconds
Frame length: 159 bytes (1272 bits)
Frame number: 96
Frame type: Data

```

## Viewing Frame Data:

```

Frame 96: 159 bytes on wire (1272 bits), 159 bytes captured (1272 bits) on interface 0
Interface Name: Intel(R) Dual Band Wireless-AC 4225-ADSL-Ethernet Adapter
Source MAC Address: Intel(R) Dual Band Wireless-AC 4225-ADSL-Ethernet Adapter (08:00:20:2d:0c:00)
Destination MAC Address: Broadcast (ff:ff:ff:ff:ff:ff)
Ether Type: Ethernet (3000)
Link Layer Type: Ethernet (3000)
Protocol Version: 2.0
Time to live: 64
Time offset: 0.000 seconds
Time since previous capture: 0.000 seconds
Time since first frame: 0.000 seconds
Time since last frame: 0.000 seconds
Time since last packet: 0.000 seconds
Time since first packet: 0.000 seconds
Time since last frame or first packet: 0.000 seconds
Frame length: 159 bytes (1272 bits)
Frame number: 96
Frame type: Data

```

Frame 96: 159 bytes on wire (1272 bits), 159 bytes captured (1272 bits) on interface 0 (Intel(R) Dual Band Wireless-AC 4225-ADSL-Ethernet Adapter)

 ▷ Domain Name System (response)

- layer 1 (line 1):

→ Frame # from the log

→ 159 bytes are on the wire  
which converts to 1272 bits  
→ 159 bytes were captured

- layer 2 (Eth layer):

→ SOURCE (src)  
→ DESTINATION (DST)  
→ Type of packet

this refers to the next header. It's an indicator in one header to tell the receiving device what's going to be in the next header so it can figure out how to pull it apart.  
It shows we have an IPv4 message so the next header will have an IP header in the next one.

Frame	Source IP	Destination IP	Protocol	Description
24	192.168.0.1	192.168.0.101	TCP	54 62538 → 53 [FIN, ACK] Seq=54 Ack=53

Domain Name System (response)

Header checksum status (ip.checksum.status)

### Layer 3

- Src & Dst IP
- Identification: 0x3304 (13060) → helps identify messages that have been broken up into fragments. Can identify different frames that are associated with this the complete packet.
- 0|0. .... = Flags: 0x2, Don't Fragment → saying don't fragment.
- ...0 0000 0000 0000 = Fragment Offset: 0 → This is the first fragment.
- Protocol: TCP/IPv4 → tells us what's the next layer going to be

Packet

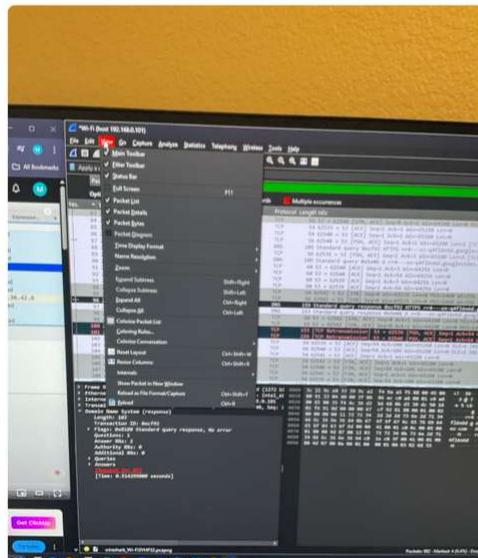

LG

- TCP Layer: Source Port: 53  
 Destination Port: 62540  
 Length: 105

} saying the  
 same thing  
 as the layers  
 in machine language.

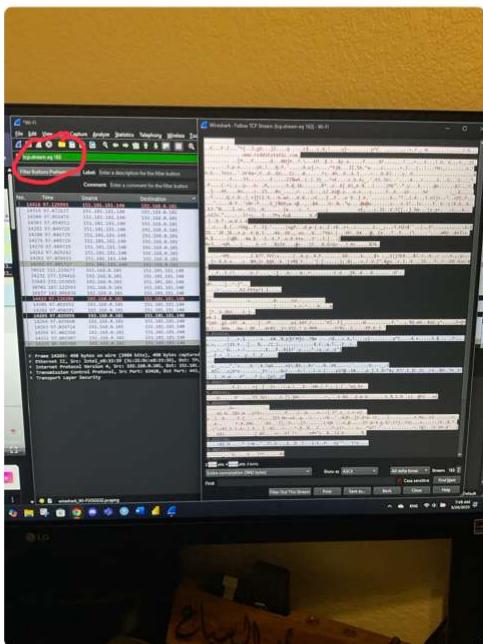

view tab

## Streams:

Communication with a website or system can be logged by wireshark.

- Step 1 → right click data frame
  - Step 2 → Press "view"
  - Step 3 → Press "TCP Stream"
- 
- Red is my laptop, blue is other system.
  - Shows its about `RedTF`.
  - This creates a capture filter

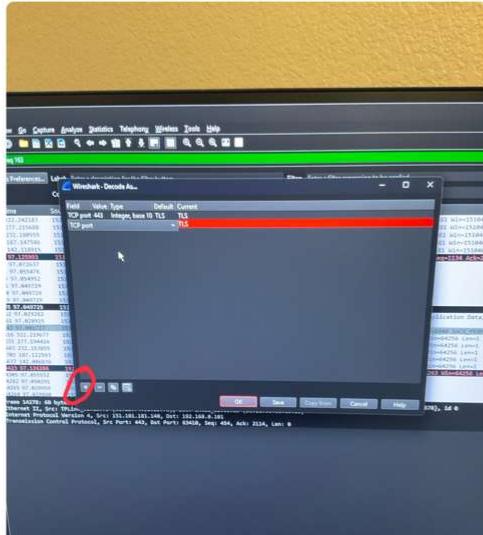

## Dissectors:

Step 1: right click a frame

Step 2: press "Decode As..."

- you can add different fields & etc. it will filter

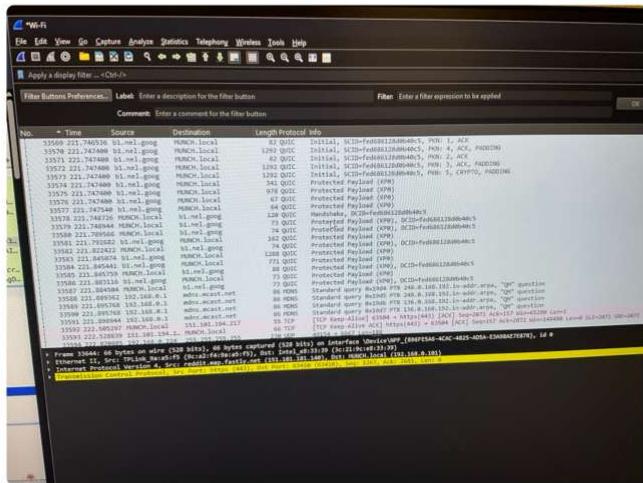

## Name Resolutions:

Step 1: Press "view"  
Step 2: "name resolution"

Physical, network transport  $\xrightarrow{\text{KDP}}$

Changes  $\xrightarrow{\text{DNS lookup}}$  Addresses to known names

Ports will also change

Saving: "Wireshark/tcpdump/... -pcap"  
is the best.

You can export specified packets  
if's in the "File" tab
